

# PredictiveCare

## Who says you can't predict the future?

Want a clear picture of your healthcare population? Then your business needs PredictiveCare. PredictiveCare gives you the visibility and insight needed to make informed medical management decisions for your population before a problem arises.

How can PredictiveCare help you do that? PredictiveCare's feature-rich applications allow you to view health care data from the member level up.

One click gives you access to:

- Virtual medical records for every enrolled individual
- Complete histories of medical and pharmaceutical claims
- Reports and analysis showing your population trends
- Information to discover the "why" behind your high-risk members

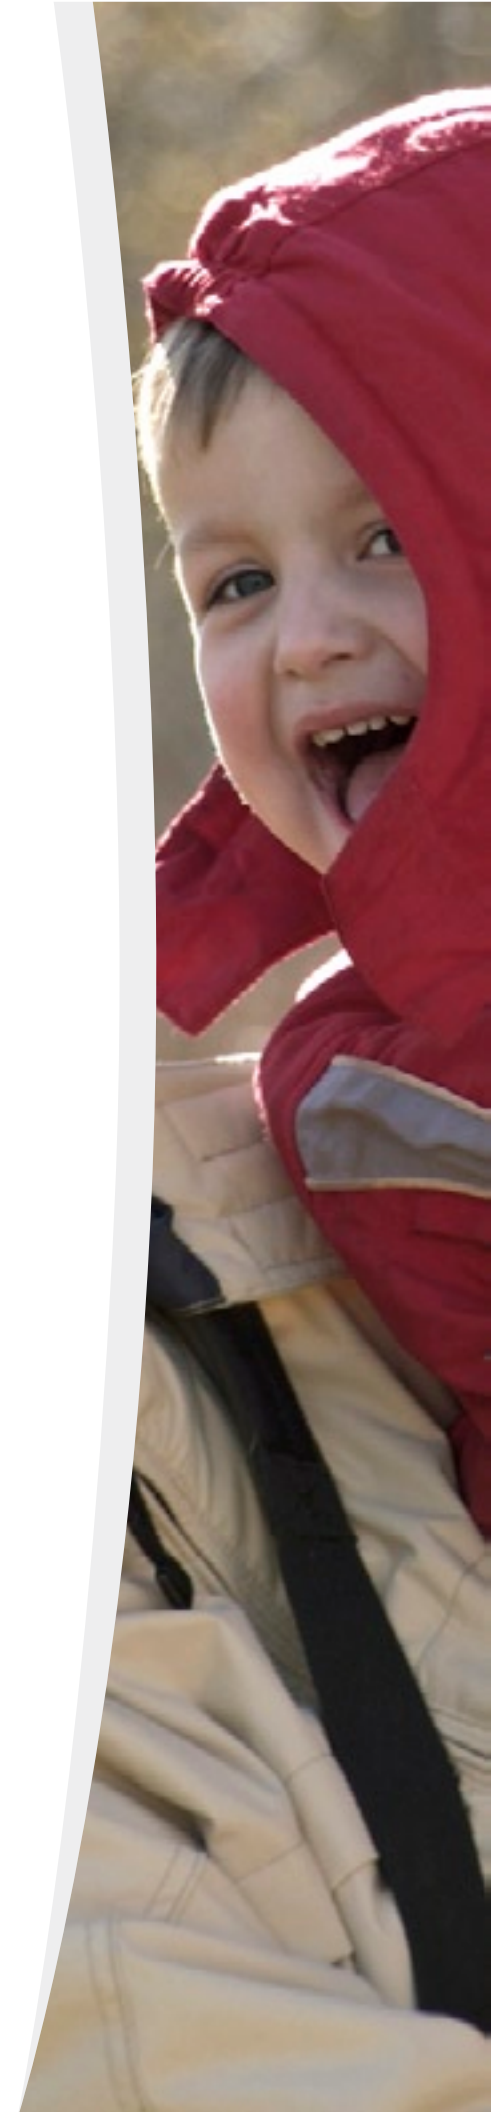

### *What can predictive care do for your business?*

- Align everyone with one, reliable version of the facts.
- With common data definitions and established priorities, you'll spend less time searching for the correct data and more time deciding what to do with it.
- Shorten the time to make the right decision.
- With self-service reporting on your key business drivers, you can see changes when they happen and make informed decisions at the right time, giving you the ability to deliver preventive care to those who need it most.
- Gain access to fragmented data sources.
- PredictiveCare takes the volume of healthcare data from your eligibility files, medical claims, case management, and pharmacy claims data and turns it into meaningful reports and analyses.

### *The Adjusted Risks Index*

The ARI is a key indicator that helps to identify members who are likely to be the most costly to your business over the course of the next year. This insight enables you to optimize their care management for a positive outcome for both them and your business.

Our PredictiveCare program utilizes a software application that has more than 300 Quality and Risk Measures. It evaluates quality of care provided and contributes to patients' Adjusted Risk Index (ARI) based on their health history. Members are broken out according to their medical condition, adherence to quality measures and by the quality of care they received.

## Intervention

CareNet's Predictive Modeling Tools can help you maintain and enhance your population's healthcare needs. PredictiveCare is a powerful monitoring and measurement tool for patient care support.

It enables you to:

- Inform and educate patients about their condition
- Empower them to be proactive in their own care management
- Inspire them to make the right choices regarding lifestyle changes

## The PredictiveCare Method

Our PredictiveCare applications import and sort your data monthly.

Here's how it works:

- Eligibility files, claims/pharmacy/lab data
- Data is stored in dedicated, client-specific data warehouse
- Implementations for new clients usually occur in less than 90 days
- Monthly updates occur within ten business days after data is received

## Reporting

PredictiveCare is a complete reporting solution that provides an analytical overview to support your care management decisions.

With PredictiveCare you can view:

- Reports by member, employer group or business unit
- Details on cost and utilization drivers
- Performance measures for vendors and providers
- Opportunities for care management and disease management
- Screens that can be exported to Excel
- Standard medical and financial reports

Let us design a customized PredictiveCare program to meet the needs of your population and your business.
